MISSION STATEMENT
To act as a model institution to alleviate the suffering of patients with cancer through the application of modern methods of curative and palliative therapy irrespective of their ability to pay, the education of health care professionals and the public and perform research into the causes and treatment of cancer.
Distraction & Coping Techniques

Various techniques are used to distract and cope with pain and discomfort during procedures. These techniques include:

- Distraction: Engaging in activities that temporarily shift focus away from the pain, such as watching TV, listening to music, or talking to a friend.
- Deep Breathing: Inhaling deeply through the nose and exhaling slowly through the mouth to reduce anxiety and promote relaxation.
- Visualization: Imagining a peaceful scene or a positive outcome to help maintain a calm state during the procedure.
- Guided Imagery: Using a specially trained person to guide the patient through a calming visual experience, typically involving a peaceful setting.

Paediatric Oncology

A team of specialists, including physicians, nurses, and psychologists, work together to ensure that children and their families receive comprehensive care. The team's goal is to provide support and resources to help children manage their illness and maintain a sense of normalcy. This includes planning activities and providing a calming environment.

Procedure

The procedure will involve the insertion of a central venous catheter under sterile conditions. The child will be positioned on a comfortable table, and the area around the insertion site will be cleansed and prepped. A local anesthetic will be administered to reduce discomfort. The catheter will then be inserted into the vein, and the site will be wrapped with sterile dressings.

Medications

Medications are vital for managing pain and reducing anxiety during the procedure. Pain medication will be administered as needed during and after the procedure, and anxiety medication may be prescribed to help the child relax.

Expressive Arts

Expressive arts therapies, such as drawing, painting, or writing, can be beneficial during the procedure. These activities can help the child express emotions and cope with the stress of the situation. The therapist will work with the child to create an environment that is safe and reassuring.
